Portfolio Collaborative Intro Animation

Google AI Studio / Argon – Project Implementation Prompt

How to use: Upload your existing portfolio project ZIP and the reference video in Google AI Studio, then paste the full prompt below.

Act as a senior creative frontend engineer, React architect, and motion-design specialist.

I have uploaded my existing React portfolio project and a reference video. Carefully inspect the uploaded video and the complete project before making changes. Reproduce the visual behavior and timing of the reference as closely as possible while respecting the requirements below.

GOAL
Create a cinematic, Figma-inspired collaborative website-building intro for my COMPLETE existing portfolio. It should look as though several designers are rapidly building my real portfolio together on a pure black screen, without showing any design-editor interface.

REFERENCE-FIRST REQUIREMENT
- Watch the supplied reference video from beginning to end; inspect the sequence, cursor behavior, movement, pacing, object manipulation, and transitions.
- Do not substitute a generic cursor animation or invent a different visual concept.
- If any detail in the reference is unclear, inspect the video frames and existing website before deciding.
- Preserve the user's specified concept; do not add unrequested visual elements.

DESKTOP / LARGE-SCREEN EXPERIENCE ONLY
- Run the full intro only on large desktop/laptop screens (use a carefully chosen breakpoint such as min-width: 1024px, and also detect coarse pointers/touch devices).
- On mobile and tablet, do not show the black intro, simulated cursors, canvas animation, or transition. Display the existing portfolio normally and immediately.
- Ensure responsive layout remains unchanged and usable on small screens.

OPENING AND VISUAL STYLE
- On every full page visit or refresh on an eligible desktop screen, start with a pure black full-screen background.
- No Figma logo or branding.
- No toolbars, menus, sidebars, panels, property inspectors, grids, or design-editor UI.
- No loading text, background music, or sound effects.
- Only the simulated collaborators, their cursor/name/action labels, and the portfolio elements being assembled should be visible.
- Begin with at least four distinct colored cursors clustered near one location.

COLLABORATOR CURSORS
- Create at least four independently animated cursors with distinct colors and collaborator names.
- Show concise live action labels, for example: “Creating layout”, “Adding heading”, “Changing color”, “Moving project card”.
- Give each cursor believable, coordinated paths and purposeful actions.
- Cursors should work simultaneously at times, not move randomly.
- Add tasteful selection outlines, resize handles, drag feedback, and text insertion effects only while relevant.
- These are simulated visual collaborators, not actual multiplayer users or network-connected cursors.

BUILD THE ACTUAL PORTFOLIO
- Inspect the existing codebase and identify all real portfolio sections and their actual content/order. Do not assume sections exist if they are not in the project.
- Use the real text, headings, skills, project names, project images, education details, contact information, colors, typography, and visual identity already present in the project.
- Animate those actual elements appearing and being arranged as if the collaborators are building the website.
- Cover the complete portfolio, including all sections that genuinely exist. Examples may include Hero, About, Skills, Projects, Education/Experience, and Contact, but do not fabricate missing sections or content.
- Do not invent placeholder projects, fake profile information, or inaccurate content.
- Do not redesign the portfolio into a different visual identity. The completed design must match the existing portfolio.

CONTINUOUS CANVAS AND CAMERA
- Present the building sequence as one continuous visual composition, not separate editor screens or section-by-section app pages.
- Use a smooth, controlled camera pan and zoom to follow the construction across the complete portfolio.
- Keep the camera movement readable and intentional; avoid fast disorienting motion.
- Do not display any canvas grid, editor frame, toolbar, or other design-software chrome. The black background should remain clean.

DURATION AND SEQUENCE
- Target approximately 25–35 seconds for the full desktop intro.
- Start: black screen, cursors clustered together.
- Early phase: cursors spread out and begin arranging the real portfolio layout.
- Middle phase: actual text, colors, buttons, images, cards, and other existing elements appear; cursors add, move, resize, align, and refine them.
- Later phase: camera smoothly follows the completed sections and the full portfolio composition becomes visible.

- Ending: smoothly transform the completed composition into the actual working portfolio website. Do not simply hide the animation and suddenly reveal the page.
- At the end, fade out every simulated cursor, label, selection outline, and handle completely.

TRANSITION TO REAL WEBSITE
- The final result must be the existing functional React portfolio, not a screenshot or static mockup.
- Avoid duplicate content, flicker, layout jumps, or mismatched positions during the transition.
- Reuse the real page sections/components wherever possible so the final rendered page is the actual site.
- After the intro, all normal website features must work.

INTERACTION DURING INTRO
- On desktop while the intro is running, prevent user clicks, keyboard actions, and scrolling from interacting with the underlying page.
- Do not show a skip button.
- Restore normal interaction immediately after the intro completes.
- Avoid trapping focus or leaving the page inaccessible after completion.

REPLAY BEHAVIOR
- Replay the intro on every eligible desktop page load/refresh.
- Do not permanently suppress it with localStorage or sessionStorage.
- Prevent duplicate animation playback caused by React Strict Mode, remounts, or resize events.
- If the viewport changes from desktop to mobile during the intro, safely cancel the intro and reveal the normal portfolio immediately.

ACCESSIBILITY AND PERFORMANCE
- Respect prefers-reduced-motion: bypass or substantially simplify the intro and show the normal portfolio.
- Avoid unnecessary dependencies; reuse the existing React, Framer Motion, and GSAP setup if appropriate.
- Clean up animation timelines, event listeners, and observers.
- Prevent memory leaks, horizontal overflow, and layout shifts.
- Keep the final website performant and fully responsive.

IMPLEMENTATION PROCESS
1. Inspect the complete uploaded project and reference video before editing.
2. Map the actual portfolio sections and identify their source components.
3. Plan the intro timeline around the real page content.
4. Implement the intro in isolated, maintainable components/styles.
5. Keep unrelated sections and existing functionality unchanged.
6. Run the production build and fix all errors.
7. Test desktop, tablet, mobile, refresh/replay, reduced-motion, and the transition into the real page.

DELIVERABLES
- Return the complete modified project files, not only code snippets.
- List every file created or modified.
- State honestly whether the production build passed; do not claim success unless it was run successfully.
- Provide exact local run/test commands.
- Explain any limitations or parts that could not be verified.

CRITICAL ACCEPTANCE CRITERIA
The desktop intro must feel like multiple skilled collaborators are rapidly constructing my real complete portfolio on a pure black screen, with no visible design-editor tools or chrome. A continuous camera smoothly follows the work for about 25–35 seconds. The finished composition seamlessly becomes the actual working portfolio, all simulated cursors disappear, and the intro replays on every desktop visit. Mobile and tablet must show the normal portfolio immediately with no intro animation.
